

Second semester Examination of English Language/ correction

Timing: 1 hour

Read the text then do the tasks that follow

Electricity is a form of energy created by the movement of charged particles such as electrons. These tiny particles move through a conductor, like a copper wire, to create an electric current. Electricity is produced in power stations, where machines called generators convert motion into electricity.

The electricity travels long distances through high-voltage cables. A transformer lowers the voltage so it can safely enter homes and buildings. Inside, the current flows through wires connected to lights, sockets, and switches. In every atom, there are protons and neutrons in a central nucleus, while electrons move around the outside. Materials that allow electricity to move freely are called conductors, while those that block it, like plastic or rubber, are called insulators. These materials are important for safety because they stop electric shocks.

TASK 1 – Answer the following questions(Use complete and short sentences) (4pts)

1. Where is electricity usually produced?
In power stations
2. How does electricity reach our homes?
It travels long distances through high voltage cable
3. Why is a transformer used before electricity enters a house?
So it can safely enter homes and buildings ...**(not safety**
4. Is plastic a good conductor of electricity?**Circle the best answer then Justify in one word**

No, because it's an ...**insulator**.....

TASK 2 – Reorder the events below according to their order in the text(Write numbers 1–6 next to each sentence) (4pts)

1. A transformer lowers the voltage of electricity.**1**
2. Conductors allow the current to move.**3**
3. Electricity enters homes and powers switches and sockets.**2**
4. Insulators protect people from electric shocks.**4**

Task Three: Find in the text words that are synonym and antonym o the following (1pt)

A. Energy (Synonym) =**electricity/ power****B- Large** (antonym)≠**Tiny**

Task Four: match each word with it definition (3pts)

- 1- **Electron:**~~a~~-A very small negatively charged particle that moves around the nucleus of an atom.
- 2- **Proton:**~~b~~-The central part of an atom that contains protons and neutrons.
- 3- **Nucleus:** ~~c~~-A positively charged particle found in the nucleus of an atom.

Task Five: fill in the blanks with the correct quantifier (many – much – a few – a little) (4ps)

- There aren't ...**many**... electrons in this part of the material.
- We only need**a few**..... copper wires to complete the circuit.
- There isn't**much**.....electricity left in the battery.
- The generator produces**a little**.....energy, but not enough to power the entire building.

Task Six: Put the verbs between brackets in their correct form tense and form of the past (4pts)

1. The technicians **did not understand**(not understand) the result until the engineer **had explained**.(explain) the experiment.
2. The electrician ...**was repairing**... (repair) the cables when the lights suddenly went off.
3. Thomas Edison ...**invented**.... (invent) the electric bulb in 1879.
